192.168.254.1/firewall_rules_edit.php?if=lan&after=-1

State type: Keep
Select which type of state tracking mechanism to use. If in doubt, use keep state.

No XMLRPC Sync: ☐ Prevent the rule on Master from automatically syncing to other CARP members
This does NOT prevent the rule from being overwritten on Slave.

VLAN Prio: none
Choose 802.1p priority to match on.

VLAN Prio Set: none
Choose 802.1p priority to apply.

Schedule: none
Leave as 'none' to leave the rule enabled all the time.

Gateway:
Leave as 'default' to use the system routing table. Or choose a gateway to utilize policy based routing.
Gateway selection is not valid for "IPv4+IPv6" address family.

In / Out pipe: none
Choose the Out queue/Virtual interface only if in is also selected. The Out selection is applied to traffic leaving the interface where the rule is created. The in selection is applied to traffic coming into the chosen interface.
If creating a floating rule, if the direction is in then the same rules apply, if the direction is Out the selections are reversed. Out is for incoming and in is for outgoing.

Ackqueue / Queue: none
Choose the Acknowledge Queue only if there is a selected Queue.

Save

Advanced Options

Source OS: Any
Note: this only works for TCP rules. General OS choice matches all subtypes.

Diffserv Code Point: [dropdown]

Allow IP options: ☐ Allow packets with IP options to pass. Otherwise they are blocked by default. This is usually only seen with multicast traffic.

Disable reply-to: ☐ Disable auto generated reply-to for this rule.

Tag: [text input]
A packet matching this rule can be marked and this mark used to match on other NAT/filter rules. It is called Policy filtering.

Tagged: ☐ Invert ☐ Tagged
Match a mark placed on a packet by a different rule with the Tag option. Check Invert to match packets which do not contain this tag.

Max. states: [text input]
Maximum state entries this rule can create.

Max. src nodes: [text input]
Maximum number of unique source hosts.

Max. connections: [text input]
Maximum number of established connections per host (TCP only).

Max. src. states: [text input]
Maximum state entries per host.

Max. src. conn. Rate: [text input]
Maximum new connections per host (TCP only).

Max. src. conn. Rates: [text input]

To direct input to this VM, move the mouse pointer inside or press Ctrl+G.

System Interfaces Firewall Services VPN Status Diagnostics Help

Alias IPv4 address

The value in this field is used as a fixed alias IPv4 address by the DHCP client.

Reject leases from

To have the DHCP client reject offers from specific DHCP servers, enter their IP addresses here (separate multiple entries with a comma). This is useful for rejecting leases from cable modems that offer private IP addresses when they lose upstream sync.

Reserved Networks

Block private networks and loopback addresses ☐

Blocks traffic from IP addresses that are reserved for private networks per RFC 1918 (10/8, 172.16/12, 192.168/16) and unique local addresses per RFC 4193 (fc00::/7) as well as loopback addresses (127/8). This option should generally be turned on, unless this network interface resides in such a private address space, too.

Block bogon networks ☒

Blocks traffic from reserved IP addresses (but not RFC 1918) or not yet assigned by IANA. Bogons are prefixes that should never appear in the Internet routing table, and so should not appear as the source address in any packets received. This option should only be used on external interfaces (WANs), it is not necessary on local interfaces and it can potentially block required local traffic. Note: The update frequency can be changed under System > Advanced, Firewall & NAT settings.

Status / System Logs / Settings

The changes have been applied successfully.

System Firewall DHCP Authentication IPsec PPP PPPoE/L2TP Server OpenVPN NTP Packages **Settings**

General Logging Options

Log Message Format **BSD (RFC 3164, default)**
The format of syslog messages written to disk locally and sent to remote syslog servers (if enabled). Changing this value will only affect new log messages.

Forward/Reverse Display ☐ Show log entries in reverse order (newest entries on top)

GUI Log Entries **500**
This is only the number of log entries displayed in the GUI. It does not affect how many entries are contained in the actual log files.

Log firewall default blocks

- ☒ Log packets matched from the default block rules in the ruleset
Log packets that are blocked by the implicit default block rule - Per-rule logging options are still respected.
- ☐ Log packets matched from the default pass rules in the ruleset
Log packets that are allowed by the implicit default pass rule - Per-rule logging options are still respected.
- ☒ Log packets blocked by 'Block Bogon Networks' rules

Data inputs

Set up data inputs from files and directories, network ports, and scripted inputs. If you want to set up forwarding and receiving between two Splunk instances, go to [Forwarding and receiving](#).

Local Inputs

Type	Inputs	Actions
Files & Directories Index a local file or monitor an entire directory.	19	+ Add new
HTTP Event Collector Receive data over HTTP or HTTPS.	0	+ Add new
TCP Listen on a TCP port for incoming data, e.g. syslog.	0	+ Add new
UDP Listen on a UDP port for incoming data, e.g. syslog.	0	+ Add new
Scripts Run custom scripts to collect or generate more data.	37	+ Add new
checkapp	0	+ Add new
Systemd Journal Input for Splunk This is the input that gets data from journal (systemd's logging component) into Splunk.	0	+ Add new
Log input for the Splunk platform This input collects data from logd on macOS and sends it to the Splunk platform.	0	+ Add new

To direct input to this VM, move the mouse pointer inside or press Ctrl+G.

Select Source Input Settings Review Done

< Back Next >

Files & Directories

Upload a file, index a local file, or monitor an entire directory.

HTTP Event Collector

Configure tokens that clients can use to send data over HTTP or HTTPS.

TCP / UDP

Configure the Splunk platform to listen on a network port.

Scripts

Get data from any API, service, or database with a script.

checkapp

Systemd Journal Input for Splunk

This is the input that gets data from journal (systemd's logging component) into Splunk.

Log input for the Splunk platform

This input collects data from logd on macOS and sends it to the Splunk platform.

Splunk Secure Gateway

Integrates the Splunk Secure Gateway application to talk to mobile clients over websockets.

Splunk Secure Gateway Mobile Alerts TTL

Cleans up storage of old mobile alerts.

Down Link Dashboard Module Input

Configure this instance to listen on any TCP or UDP port to capture data sent over the network (such as syslog). [Learn More](#)

☐ TCP ☒ UDP

Port
Example: 514

Source name override
host:port

Only accept connection from
example: 10.1.2.3, badhost.splunk.com, *splunk.com

FAQ

- > How should I configure the Splunk platform for syslog traffic?
- > What's the difference between receiving data over TCP versus UDP?
- > Can I collect syslog data from Windows systems?
- > What is a source type?

Input Settings

Optionally set additional input parameters for this data input as follows:

Source type value is required.

Source type

The source type is one of the default fields that the Splunk platform assigns to all incoming data. It tells the Splunk platform what kind of data you've got, so that the Splunk platform can format the data intelligently during indexing. And it's a way to categorize your data, so that you can search it easily.

Source Type: PFSENSE FW

Source Type Category: Custom

Source Type Description: PFSENSE FW SYSTEM LOGS

App Context: Apps Browser (appbrowser)

Method: IP DNS Custom
